

S519/ S521/ S522

New Style

The two outer terminals are for the ignition/ neutral safety. They are also labeled "IGN."

The two inner terminals are for the reverse lights. They are also labeled "REV."

This switch is a simple circuit interrupt. There is no specific in or out for each pair of terminals. The terminals are standard spade/ blade terminals so any female spade terminal will work and are recommended.

New Style

Ensure that the tab on the shifter is positioned in the slot on the switch tab. This is what actuates the switch. If it is not positioned properly the switch will not actuate and function.

The switch's mounting tabs are slotted to allow for adjustment. Adjusting your switch is important to allow for the car to be started in park and neutral and for the reverse lights to come on when the car is in reverse. When buying one of our shifter packages, our switches are already adjusted on the shifters.
